What is battery module and Pack testing?

This complex technique is used to understand the impedance characteristics and chemical reactions of an individual cell. The application drives what type of battery module and pack testing is needed (Fig. 5). Battery module and pack testing involves very little testing of the internal chemical reactions of the individual cells.

What is a battery pack?

A battery pack contains any number of battery modules along with additional connectors, electronics, or packaging. The above distinction is important as battery cells are treated as individual components whereas battery modules and packs are treated as an assembly (reference Figure 3).

What is the difference between battery cell and battery pack?

A battery cell is a single device that converts chemical energy into electrical energy. A battery module contains any number of cells along with connectors, electronics, or additional mechanical packaging. A battery pack contains any number of battery modules along with additional connectors, electronics, or packaging.

How does a battery pack work?

A battery pack is made up of multiple cells connected in series. Even slight variations in individual cell characteristics can significantly affect the overall performance of the battery pack. That's why it's essential to monitor voltage and temperature at the cell level, and not just the pack level.
