-----  
Why is degradation of a PV module important?

Financially, degradation of a PV module or system is equally important, because a higher degradation rate translates directly into less power produced and, therefore, reduces future cash flows. Furthermore, inaccuracies in determined degradation rates lead directly to increased financial risk .

How many measurements are taken to measure solar degradation rates?

This trend is readily explainable by the more widespread availability of solar simulators. Figure 7 indicates the number of measurements that were taken to measure degradation rates. It is noteworthy that a high percentage of references take only one or two measurements to report degradation rates.

How much does a solar system degrade over time?

Individual module efficiencies varied widely, with some improving by more than 10% while others degraded by more than 10% over a 5.5-year test period. However, the overall system degraded by approximately 0.6%/year. Ross et al. found a similar degradation rate for a system located in the hot and dry climate of Tucson, AZ, USA, over 3 years .

What is the degradation rate of a SI system?

Apicella et al. reported a degradation rate of approximately 1%/year for a single junction a-Si system in Italy . A much higher rate was found for a microcrystalline Si system, possibly reflecting the maturity of the technology.

SJCE is governed by your San Jose City Council, with input from a Community Advisory Commission. All SJCE decisions are made by Council during public meetings, where ...

We break down the seven best solar installers in San Jose, CA. Our ratings are based on our expert reviews and reviews from homeowners who have already gone solar in San Jose. See ...
