What is a constant voltage-controlled photovoltaic (PV) water pumping system?

Provided by the Springer Nature SharedIt content-sharing initiative Policies and ethics This paper presents a study about a constant voltage-controlled photovoltaic (PV) water pumping system and compares it with a directly controlled PV water pumping system. The voltage-controlled PV system employs a constant voltage maximum power point tracking...

What is a voltage-controlled PV system?

The voltage-controlled PV system employs a constant voltage maximum power point tracking algorithm because of its easy implementation for both digital and analog circuits whereas a directly connected PV system, directly connects the PV array to the DC motor through a DC-DC converter.

What is the reference voltage for a constant voltage-controlled set?

For a constant voltage-controlled set, the reference voltage is 293 V (solar irradiance of 1000 W/m² and cell temperature is at 25 °C) and is compared with voltage at different solar irradiances.

How does a solar power converter work?

The converter effectively extracts the maximum power from the PV array when the measured power equals the reference values. Irradiation (W/m²) and temperature (?) of the solar system at particular locations decide the PV array's voltage rating. DC-DC conversion integrated with MPPT.

The system delivers a constant voltage, and the current delivered to the system reduces. The charging system operates in this mode until the battery reaches 100% charge.
